Education

KIET Group of Institutions, Delhi-NCR — B.Tech, Computer Science and Engineering (2nd Year) | GPA: 8.3/10 2024 – 2028

Experience

Backend Developer — Credible (DeFi Infrastructure), Remote Oct 2025 – Present

- Architected high-availability backend services in **Go** and **TypeScript** powering smart contract interaction layers for a live DeFi protocol serving production traffic.
- Slashed event-processing latency by designing a real-time on-chain data ingestion pipeline that tracks liquidity movements across 3+ token pools with sub-100ms event propagation.
- Eliminated 40%+ of unnecessary RPC round-trips through query batching and caching strategies, improving throughput for latency-sensitive financial operations.

Projects

Naive GFS (Google File System) | Go GitHub

- Reconstructed the Google File System paper from scratch in Go, delivering a working master-chunkserver-client architecture over RPC that handles concurrent reads and writes across 3 simulated nodes.
- Hardened reliability via chunk replication and fault-tolerant write semantics, achieving consistent data recovery after simulated node failures.

Kademlia Distributed Hash Table | Go GitHub

- Engineered a fully spec-compliant **Kademlia DHT** in Go with XOR-metric routing, k-bucket eviction, and iterative FIND_NODE lookup converging in $O(\log n)$ hops.
- Eliminated single-point-of-failure by enabling decentralized key-value storage and peer discovery across an unbounded number of nodes with no central coordinator.

MintCraft — AI Model Registry & Marketplace | TypeScript, Rust, Next.js, tRPC, PostgreSQL GitHub

- Delivered a production-grade, 5-service full-stack marketplace enabling creators to register AI models, meter usage, and mint outputs as NFTs on Solana using Anchor programs.
- Designed the API layer with **Express** + **tRPC** and **Prisma** on **PostgreSQL**; wired programmable usage-fee splits and automatic royalty settlement directly into on-chain program state.

Raft Consensus Simulator | Go GitHub

- Shipped a complete **Raft** simulator covering leader election, log replication, and safety invariants; correctly handles split-vote scenarios and network partition recovery across 5-node clusters.

Learn — Developer Learning Platform | TypeScript, Next.js GitHub | Live

- Launched a live full-stack learning platform (44+ commits) in **Next.js 14** and **TypeScript**, with shadcn/ui components, Tailwind CSS, and ESLint enforcing zero-warning production builds.

Open Source Contributions

- **Node.js core** nodejs/node#62541 — Contributed `req.signal (AbortSignal)` to `IncomingMessage`; PR merged as **semver-minor** into Node.js main, removing boilerplate from client-disconnect handling across the entire Node.js HTTP ecosystem. Approved by core collaborators mcollina, ronag, and pimterry.
- **Pixi / prefix-dev** prefix-dev/pixi#5288 — Introduced `-dry-run` flag to the `pixi lock` CLI in this **6.8k-star** Rust project; added `DryRun` lock-file mode with `MockRepoData`-backed integration tests. Shipped in **Pixi v0.64.0**.

Technical Skills

Languages: Rust, Go, TypeScript, JavaScript, C++, Solidity

Backend: Node.js, tRPC, Express, PostgreSQL, MongoDB, Prisma, Redis, Apache Kafka, RabbitMQ, Appwrite, Firebase, Supabase

Tooling & Infrastructure: Docker, Kubernetes, Git, eBPF (Cilium), FFmpeg, Ngrok, GitHub Actions

Domains: Distributed Systems, Backend Engineering, Systems Programming, Networking, Decentralized Finance
