Education

KIET Group of Institutions, Delhi-NCR

2024 – 2028

B.Tech, Computer Science and Engineering (2nd Year)

Experience

Backend Engineer

Oct 2025 – March 2026

Credible (Infrastructure Platforms), Remote

- Architected high-availability backend services in Go and TypeScript powering high-throughput API gateway and event-driven microservices serving production traffic.
- Slashed event-processing latency by designing a real-time distributed data ingestion pipeline that tracks liquidity movements across multiple distributed data streams with sub-100ms event propagation.
- Eliminated 40%+ of unnecessary RPC round-trips through query batching and caching strategies, improving throughput for latency-sensitive financial operations.

Projects

Raft Consensus Simulator | Go

[GitHub](#)

- Shipped a complete Raft simulator covering leader election, log replication, and safety invariants; correctly handles split-vote scenarios and network partition recovery across 5-node clusters.

MintCraft AI Model Registry & Marketplace | TypeScript, Rust, Next.js, tRPC, PostgreSQL

[GitHub](#)

- Delivered a production-grade, 5-service full-stack registry and marketplace enabling creators to register AI models, monitor usage, and provision API access tokens securely.
- Designed the microservices API layer with Express, Rust, tRPC, and Prisma on PostgreSQL; built highly optimized, automated usage-fee billing and royalty distribution logic based on precise runtime execution metrics.

Learn Developer Learning Platform | TypeScript, Next.js

[GitHub Live](#)

- Launched a live full-stack learning platform (44+ commits) in Next.js 14 and TypeScript, utilizing shadcn/ui components, Tailwind CSS, and ESLint enforcing zero-warning production builds.

Kademlia Distributed Hash Table | Go

[GitHub](#)

- Engineered a fully spec-compliant Kademlia DHT in Go with XOR-metric routing, k-bucket eviction, and iterative FIND_NODE lookup converging in $O(\log n)$ hops.
- Eliminated single-point-of-failure by enabling decentralized key-value storage and peer discovery across an unbounded number of nodes with no central coordinator.

Naive GFS (Google File System) | Go

[GitHub](#)

- Reconstructed the Google File System paper from scratch in Go, delivering a working master-chunkserver-client architecture over RPC that handles concurrent reads and writes across 3 simulated nodes.
- Hardened reliability via chunk replication and fault-tolerant write semantics, achieving consistent data recovery after simulated node failures.

Open Source Contributions

Node.js core ([nodejs/node#62541](https://github.com/nodejs/node/pull/62541))

- Contributed `req.signal` (`AbortSignal`) to `IncomingMessage`; PR merged as semver-minor into Node.js main, removing boilerplate from client-disconnect handling across the entire Node.js HTTP ecosystem. Approved by core collaborators.

Pixi / prefix-dev ([prefix-dev/pixi#5288](https://github.com/prefix-dev/pixi/pull/5288))

- Introduced `--dry-run` flag to the `pixi lock` CLI in this 6.8k-star Rust project; added `DryRun` lock-file mode with `MockRepoData`-backed integration tests. Shipped in Pixi v0.64.0.

Technical Skills

Languages: Rust, Go, TypeScript, JavaScript, C++, SQL

Systems & Platform Engineering: Kubernetes (CNCF), Docker (CNCF), eBPF (Cilium), Kmesh, Linux Systems, Networking, RPC Architecture

Backend & Cloud: Node.js, tRPC, Express, PostgreSQL, MongoDB, Prisma, Redis, Apache Kafka, RabbitMQ, gRPC, Supabase

Tooling & Infrastructure: Git, FFmpeg, Ngrok, GitHub Actions, CI/CD, Linux CLI

Domains: Distributed Systems, Systems Programming, Cloud-Native Engineering, High-Throughput Networking, Platform Engineering
